

DOCKERIZE (Nodejs & PostgreSql)

I am using 2 images & 2 containers and connecting them in Docker. Building backend image with Dockerfile and db image from postgres inbuilt image on docker hub.

You can either download node-web-image

from this command -> `Sudo docker pull 041298amit/node-web-app`

Or

you can built the image from Dockerfile in the code

From this command -> `docker build -t 041298amit/node-web-app .`

For postgres image pull from docker hub or use this -> `docker pull postgres`

After getting both images just use command -> `docker-compose up` for starting the servers.
